

SaraINyaya: Democratizing Access to Indian Law

Using AI to simplify complex legal jargon and
make justice accessible to the common citizen.

The legal system demands expertise from those seeking basic help

The Applicant Burden: Citizens are expected to understand complex government-style workflows before they can even ask for help.

The Lawyer Burden: Pro-bono lawyers must manually browse and sift through pending, unfiltered queues to find relevant matters.

The Translation Gap: There is no bridge between plain-language citizen grievances and structured legal categorization.

Removing the friction of legal aid through intelligent routing

A balanced ecosystem serving both sides of the match

The Vulnerable Applicant

Guided eligibility legal-aid screening.

Plain-language case intake with optional past-document upload.

Secure, permissioned document sharing.

Real-time progress dashboard with next hearing dates.

The Pro-Bono Lawyer

Public directory presence with state, court, and specialty filters.

Self-attested onboarding with past case history tracking.

Dedicated assignment workspace.

Elimination of manual matter browsing.

The User Journey: From messy input to structured match

The innovation is the elimination of the search phase

**Plain Language
Input**

**Specialized
Lawyer Profile**

SaraNyaya's true power isn't just digitizing legal forms—it is entirely bypassing the 'browse and search' phase.

- Applicants never have to guess which lawyer handles their specific issue.
- Lawyers never have to sift through irrelevant queues.
- Transparent auto-routing instantly connects the right need to the right expertise.

How the heuristic matching engine calculates fit

The portal builds simple feature graphs and keyword signals for both sides, ranking lawyers using overlap and rule-based scoring while keeping the reasons visible to admins.

The AI Evolution: Pragmatic steps from Heuristics to Semantics

Dimension	Current MVP	Future Upgrade
Mechanism	Rule-based scoring + Extracted keywords	Model-based ranking + Semantic embeddings
Example Trigger	Exact term overlap (e.g., both use 'wage issue')	Implicit meaning (e.g., 'salary not paid' matches 'employment separation compensation')
Cost & Infrastructure	Low cost, runs locally, highly explainable	Requires external API/LLM overhead, handles complex legal fact patterns
Language Flexibility	Reliant on shared vocabulary	Understands mixed-language descriptions and varied wording

Built for lightweight deployment and rapid iteration

Demonstrated Scalability:
Seeded with realistic demo data handling 1000 lawyer profiles, 100 cases, and continuous auto-assignment without heavy external dependencies.

The Blueprint: Scaling zero-friction legal access

Workflow Refinement: Add lawyer accept/reject flows after automatic routing to optimize availability.

Algorithmic Upgrade: Transition from heuristic feature graphs to embeddings and model-based ranking.

Omnichannel Intake: Activate the existing /api/whatsapp/intake endpoint for automated chat-based account linking and case submission.

Verification Integrity: Implement verified lawyer approval workflows and comprehensive audit trails.

Granular Logistics: Introduce district-level routing, notifications, and system reminders.
